Highly oxidation resistant component

Field of the invention

5

This invention relates to a component, especially a blade or vane of a gas turbine, with a high oxidation resistance.

10 Background of the invention

Metallic components, which are exposed to high temperature must be protected against heat and corrosion.

15 Especially for gas turbines with its combustion chamber or its turbine blades or vanes it is common to protect the components with an intermediate, protective MCrAlY layer (M= Fe, Co, Ni), which provides oxidation resistance, and a ceramic thermal barrier coating, which protects the substrate
20 of the metallic component against the heat.

An aluminium oxide layer is formed between the MCrAlY- and the thermal barrier coating due to oxidation.

25 For a long life term of a coated component it is required to have a good connection between the MCrAlY layer and the thermal barrier coating, which is provided by the bonding of the thermal barrier coating and the oxide layer onto the MCrAlY layer.

30

If a thermal mismatch between the two interconnecting layers prevails or if the ceramic layer has no good bonding to the aluminum oxide layer formed on the MCrAlY layer, spallation of the thermal barrier coating will occur.

35

From the US-PS 6,287,644 a continuously graded MCrAlY bond coat is known which has an continuously increasing amount of

Chromium, Silicon or Zirconium with increasing distance from the underlying substrate in order to reduce the thermal mismatch between the bond coat and the thermal barrier coating by adjusting the coefficient of thermal expansion.

5

The US-PS 5,792,521 shows a multi-layered thermal barrier coating.

10 The US-PS 5,514,482 discloses a thermal barrier coating system for superalloy components which eliminates the MCrAlY layer by using an aluminide coating layer such as NiAl, which must have a sufficiently high thickness in order to obtain its desired properties. Similar is known from the US-PS 6,255,001.

15

The NiAl layer has the disadvantage, that it is very brittle which leads to early spallation of the onlaying thermal barrier coating.

20 The EP 1 082 216 B1 shows an MCrAlY layer having the γ -phase at its outer layer. But the aluminum content is high and this γ -phase of the outer layer is only obtained by re-melting or depositing from a liquid phase in an expensive way, because additional equipment is needed for the process of re-melting
25 or coating with liquid phase.

Summary of the invention

30 In accordance with the foregoing is an object of the invention to describe a protective layer with a good oxidation resistance and also with a good bonding to the thermal barrier coating.

35 The task of the invention is solved by a protective layer which has one underlying conventional MCrAlY layer on which

different compositions of MCrAlY and/or other compositions are present as an outer layer.

One possibility is that the outer layer zone has a composition chosen such that it possesses the β -NiAl-structure.

Another possibility is that the outer layer zone is a MCrAlY layer zone which has at least a matrix of the γ -Ni solid solution phase.

Especially the MCrAlY layer, which consists of γ -Ni solid solution, is chosen such, that the material of the MCrAlY-layer can be applied e.g. by plasma-spraying. This has the advantage that the outer layer can be deposited in the same coating equipment directly after the deposition of the inner layer (MCrAlY) without re-melting the surface in another apparatus.

The protective layer can be a continuously graded, a two layered or a multi-layered coating.

Brief description of the drawings:

Figure 1 shows a heat resistant component as known by state of the art,
Figure 2, 3 examples of an inventive oxidation resistant component.

Detailed description of the invention

The invention may be embodied in many different forms and should not be construed as limited to the illustrated embodiments set forth herein. Rather, these illustrated embodiments are provided so that this disclosure will be

thorough and complete, and will fully convey the scope of the invention to those skilled in the art.

Figure 1 shows a heat resistant component as known by state
5 of the art.

The highly oxidation resistant component has a substrate 4, a
MCrAlY layer 7 on the substrate, on which a thermally grown
oxide layer 10 (TGO) is formed or applied and finally an
10 outer thermal barrier coating 13.

Figure 2 shows an highly oxidation resistant component 1
according the invention.

15 The component 1 can be a part of gas turbine, especially a
turbine blade or vane or heat shield.

The substrate 4 is metallic, e.g. a super alloy (NiAl based,
e.g.)

20 On the substrate 4 the MCrAlY layer zone 16 is a conventional
MCrAlY layer 16 of the type e.g. NiCoCrAlY with a typical
composition (in wt%) 10% - 50% Cobalt (Co), 10% - 40% Chromium
(Cr), 6% - 15% Aluminium (Al), 0,02% - 0,5% Yttrium (Y) and
Nickel (Ni) as base or balance.

25 This MCrAlY layer 16 may contain further elements such as:
0,1% - 2% Silicon (Si), 0,2% - 8% Tantal (Ta), 0,2% - 5%
Rhenium (Re).

30 Instead at least a part of Yttrium or in addition this MCrAlY
layer zone 16 can also contain Hafnium (Hf) and/or Zirconium
(Zr) and/or Lanthanum (La) and/or Cerium (Ce) or other
elements of the Lanthanide group.

35 The thickness of this conventional layer 16 is in the range
from 100 to 500 micrometer and is applied by plasma spraying
(VPS, APS) or other conventional coating methods.

In this example the inventive highly oxidation resistant component 1 reveals a MCrAlY layer 16 with another outer layer zone 19 on top, which forms together with the layer zone 16 the protective layer 17.

For example, the outer layer zone 19 consists of the phase β -NiAl. The thickness of this layer 19 is in the range between 1 and 75 micrometer, especially up to 50 micrometer.

The disadvantage of brittleness of the β -NiAl phase is overcome by the fact that the β -NiAl layer 19 is thin compared to the MCrAlY layer 16.

The outer layer 19 can solely consist of the two elements Ni and Al. The concentration of these two elements is given by the binary phase diagram Ni-Al and must be chosen in such a way that the outer layer 19 consists of pure β -NiAl phase at the temperature at which the oxidation of the layer 19, which forms the TGO 10, occurs (21-37wt% Al).

Nevertheless this β -NiAl phase can contain further alloying elements as long as these elements do not destroy the phase β -NiAl phase structure. Examples of such alloying elements are chromium and/or cobalt. The maximum concentration of chromium is given by the area of the β -phase in the ternary phase diagram Ni-Al-Cr at the relevant temperatures. Cobalt has a high solubility in the β -NiAl phase and can nearly completely replace the nickel in the NiAl-phase.

Similar further alloying elements can be chosen such as Si (Silicon), Re (Rhenium), Ta (Tantal).

The main requirement of the alloying elements is, that it does not lead to the development of new multi-phase structures.

Also elements (additions) such as Hafnium, Zirconium, Lanthanum, Cerium or other elements of the Lanthanide group,

which are frequently added to improve the properties of MCrAlY coatings, can be added to the β -phase layer.

5 The NiAl based layer is applied by plasma spraying (VPS, APS) and/or other conventional coating methods.

The advantage of the β -NiAl phase structure is that a meta-stable aluminum oxide (θ - or a mixture with γ -phase) is formed in the beginning of the oxidation of the layer 19.

10 The TGO (e.g. aluminum oxide layer) 10 which is formed or applied on the outer layer 19 has a desirable needle like structure and leads therefore to a good anchoring between the TGO 10 and the ceramic thermal barrier coating 13.

15 On conventional MCrAlY coatings, usually the stable α -phase of aluminium oxide is formed upon high temperatures exposure of the coating. However during the use of the heat resistant component 1 with its outer layer 19 meta-stable aluminum
20 oxide 10 is allowed to be transformed into the stabile α -phase during high temperature exposure, which leads to a desirable microporosity in the TGO.

25 Another possibility of a component 1 according to the invention is given in such a way that the standard MCrAlY layer 16 is of the type NiCoCrAlY and has an amount of aluminium between 8% to 14 wt% with a thickness from 50 to 600 micrometer, especially between 100 and 300 micrometer.

30 On this MCrAlY layer 16 a second MCrAlY layer zone 19 of the type NiCoCrAlY is applied. The composition of this second layer is chosen in such a way that the modified MCrAlY layer 19 as outer layer 19 shows at a high application temperature (900° - 1100°C) a pure γ -Ni matrix. A suitable composition of
35 the second layer (19) can be derived from the known phase diagrams Ni-Al, Ni-Cr, Co-Al, Co-Cr, Ni-Cr-Al, Co-Cr-Al.

Compared to conventional MCrAlY coatings this modified MCrAlY layer 19 has a lower concentration of aluminum with a concentration of aluminum between 5 - 6.5 wt %, which can easily be applied by plasma spraying by only changing the powder feed of the plasma spraying apparatus accordingly.

However, layer 19 can also be applied by other conventional coating methods.

A typical composition of this modified MCrAlY layer 19 which consists of γ -phase is: 15 - 40 wt% chromium (Cr), 5 - 80 wt% Cobalt (Co), 3 - 6.5 wt% Aluminium (Al) and Ni base, especially 20 - 30wt% Cr, 10 - 30wt% Co, 5 - 6wt% Al and Ni base.

Instead of Yttrium this MCrAlY layer zone 19 can also contain further additions so called reactive elements such as Hafnium (Hf) and/or Zirconium (Zr) and/or Lanthanum (La) and/or Cerium (Ce) or other elements of the Lanthanide group, which are commonly used to improve the oxidation properties of MCrAlY coatings.

The total concentration of these reactive elements may be in the range between 0,01 and 1 wt%, especially between 0,03 and 0,5 wt %.

The thickness of the modified MCrAlY layer 19 is between 1 and 80 micrometer especially between 3 and 20 micrometer. Further alloying elements can be chosen such as Sc (Scandium), Titanium (Ti), Re (Rhenium), Ta (Tantal), Si (Silicon).

The formation of the desired meta-stable aluminum oxide on top of the modified γ -phase based MCrAlY layer 19 can be obtained by oxidation of the modified MCrAlY layer 19 at a temperature between 850°C and 1000°C, especially between

875°C and 925°C for 2 - 100 hours, especially between 5 and 15 hours.

5 The formation of these meta-stabile aluminum oxide during that mentioned oxidation process can be promoted by addition of water vapour (0.2-50vol%, especially 20-50vol%) in the oxidation atmosphere or by the use of an atmosphere with a very low oxygen partial pressure at a temperature between 800°C and 1100°C, especially between 850°C and 1050°C.

10 In addition to water vapour the atmosphere can also contain non oxidating gases such as nitrogen, argon or helium.

Because the modified MCrAlY layer 19 is thin, aluminum from the inner or standard MCrAlY layer 16 can diffuse through the modified MCrAlY layer 19 in order to support the formation of aluminum oxide on the outer surface of the layer 19 during long term service, which could not be performed by the modified MCrAlY layer 19 alone because of its low concentration of aluminum.

20

Figure 2 shows a two layered protective layer 17.

25 Figure 3 shows a further component 1 according to the invention with a high oxidation resistance.

The concentration of the MCrAlY layer 16 is continuously graded in such a way, that near the substrate 4 the composition of the MCrAlY layer 16 is given by a standard MCrAlY layer 16 as described in figure 2 or 1, and that near the thermal barrier coating 13 the composition of the outer layer 19 shows the composition of the layer 19 as described in figure 2.

35

On the outer layer zone (19) a thermal barrier coating (TBC) (13) is applied. Due to the good oxidation resistance of the protective layer (17) and the good bonding of the TBC to the TGO (10) due to adjustment of structure, phases and
5 microstructure the life term of the component 1 is prolonged.

claims

1. Highly oxidation resistant component (1),
having a substrate (4),
5 a protective layer (17),
which consists of
an intermediate MCrAlY layer zone (16) on or near the
substrate (4),
wherein M is at least one element out of the group Co,
10 Fe, Ni,
and an outer layer zone (19)
which consists at least of the elements Ni and Al and
possesses the structure of the phase β -NiAl, and
wherein the outer layer zone (19) is onto the
15 intermediate MCrAlY layer zone (16).
2. Highly oxidation resistant component (1),
having a substrate (4),
a protective layer (17),
20 which consists of
an intermediate MCrAlY layer zone (16) on or near the
substrate (4),
wherein M is at least one element out of the group Co,
Fe, Ni,
25 and an outer MCrAlY layer zone (19)
which has the structure of the phase γ -Ni and has a
content of Aluminum of up to 6.5wt%, and
wherein the outer MCrAlY layer zone (19) is onto the
intermediate MCrAlY layer zone (16).
30
3. Highly oxidation resistant component according to claim 1
or 2,
wherein the protective layer (17) consists of two
separated layers (16, 19).

4. Highly oxidation resistant component according to claim 1
or 2,
with a continuously graded concentration of the
composition of the intermediate and outer zone (16, 19)
inside the protective layer (17).
5. Highly oxidation resistant component according to claim 1
or 2,
wherein the outer layer zone (19) is thinner than the
intermediate layer (16) on or near the substrate (4).
6. Highly oxidation resistant component according to claim 1
or 2,
wherein the intermediate MCrAlY-layer zone (16) has the
composition (in wt%): 10% - 50% Co, 10% - 40% Cr, 6% -
15% Al, 0,02% - 0,5% Y, Ni base.
7. Highly oxidation resistant component according to claim 1
or 2,
wherein the intermediate MCrAlY-layer (16) or the outer
layer zone (19) contains at least one further element
such as (in wt%): 0,1% - 2% Si, 0,2% - 8% Ta or 0,2% - 5%
Re.
8. Highly oxidation resistant component according to claim 1
or 2,
wherein the Yttrium of MCrAlY of the intermediate MCrAlY
zone (16) or the outer zone (19) is added and/or at least
partly replaced by at least one element out of the group
Hf, Zr, La, Ce and/or other elements of the Lanthanide
group.

9. Highly oxidation resistant component according to claim 1, wherein the outer layer zone (19) contains the element chromium.
- 5 10. Highly oxidation resistant component according to claim 1, wherein the outer layer zone (19) contains the element cobalt.
- 10 11. Highly oxidation resistant component according to claim 1, wherein the outer zone (19) is added at least one additional element out of the group Hf, Zr, La, Ce or other elements of the Lanthanide group.
- 15 12. Highly oxidation resistant component according to claim 2, wherein the outer layer (19) zone has the composition (in wt%): 15 - 40% Cr, 5 - 80% Co, 3 - 6.5% Al and Ni base.
- 20 13. Highly oxidation resistant component according to claim 2, wherein the outer layer (19) zone has the composition (in wt%): 20 - 30% Cr, 10 - 30% Co, 5 - 6% Al and Ni base.
- 25 14. Highly oxidation resistant component according to claim 11, wherein the maximum amount of the additions is 1wt%.
- 30 15. Highly oxidation resistant component according to claim 1 or 2, wherein the MCrAlY layer zone (16, 19) contains Ti (Titanium) and/or Sc (Scandium).
- 35 16. Highly oxidation resistant component according to claim 1 or 2, wherein on the outer layer zone (19) a thermal barrier coating (13) is formed.

EPO - Munich

09. Juli 2002

Summary

Highly oxidation resistant component

- 5 Highly oxidation resistant components as known in state of the art disclose a MCrAlY layer, which shows a poor anchoring between the thermal barrier coating and the oxide layer on the MCrAlY layer.
- 10 The inventive heat resistant component (1) discloses a MCrAlY layer (16), which has an outer layer (19) of the composition of β -NiAl or γ -Ni, so that a meta-stabile aluminium oxide is formed, which leads to a good anchoring of the thermal barrier coating (13) to the thermally grown oxide layer.
